Work Plan:
Data Curation Query Package

v3.12
December 21, 2017

TABLE OF CONTENTS

I. Purpose and Scope

The purpose of the Data Curation Query Package v3.12 is to characterize the data in the 15 PCORnet Common Data Model (CDM) v3.1 tables. The package consists of the PCORnet code errors query, the data curation query and an Empirical Data Curation Report which summarizes key information from the data curation query output and evaluates the results against PCORnet's Data Check v4. Output tables will be produced by running SAS programs against static local DataMarts in PCORnet CDM v3.1 with SAS data types.

Query results will be used by the PCORnet Coordinating Center's Distributed Research Network Operations Center (DRN OC) to ensure a foundational level of data quality across the networks. Approved results may be used to provide initial feasibility estimates for prep-to-research queries, inform study planning activities, and to create DataMart-level, CDRN-level or network-level reports. Data aggregated at the network level may be shared publicly. DataMart-level results such as the metadata transparency reports may be published within PCORnet upon review and approval by the CDRN principal investigator (PI).

To provide the DRN OC with additional insight into the query results, the ETL Annotated Data Dictionary (ETL ADD) must be updated prior to submitting a query response. The ETL ADD is stored in a REDCap® database.

Low Cell Count Threshold
DataMart Administrators may specify a low cell count threshold which establishes the minimum number of observations required to protect against possible identification of subject data. The default low cell count threshold value is set to eleven (11) in accordance with PCORnet's minimum bin size policy. Query results greater than zero and less than the threshold will be changed to BT (below threshold) and treated as missing. For example, if a DataMart sets a low cell count threshold of 5, cell counts between 1 and 4 will be changed to BT. The DRN OC recommends setting low cell count thresholds no higher than 51. The low cell count threshold applies to all query results except for descriptive statistics. The low cell count threshold treatment for each query is shown in Section IV.

Potential Code Errors Report
The query package produces a Potential Code Errors report which identifies exceptions to the expected code length or content for ICD9/ICD10 diagnosis codes; ICD9/ICD10-PCS and CPT/HCPCS procedure codes; LOINC codes; RXNORM_CUI codes; and NDC codes by applying the heuristics described in section II.

Data Curation Query
The query package produces up to 158 query output tables depending on how many CDM tables are populated. Information about each output table is provided in Sections IV and Sections XII-XXV. Please note that for tables which are cross-tabs of two fields, the table shells only contain certain example cells.

Empirical Data Curation Report
The query package produces an Empirical Data Curation (EDC) report. The EDC Report summarizes key information from the data curation query ouput tables and identifies exceptions to the PCORnet Data Checks v4. The table of contents is shown in Section V.

Questions about this query package should be sent to Laura Qualls (laura.qualls@duke.edu).

II. PCORnet Code Errors Query

The purpose of the PCORnet Code Errors query is to help network partners identify exceptions to the expected formats for selected codes. The query identifies exceptions to the expected code length or content for ICD9/ICD10 diagnosis codes; ICD9/ICD10-PCS and CPT/HCPCS procedure codes; LOINC codes; RXNORM_CUI codes; and NDC codes by applying the following heuristics. Heuristics are conservative to allow for all potential implementations (e.g. current LOINC codes are 5+ digits, but the program allows for the shorter deprecated codes). These heuristics will **not** identify all erroneous codes. Partners are not expected to cleanse source data but should correct ETL errors.

Code	Code Type	Unexpected length (after removing decimals if applicable)	Unexpected string	Unexpected alphabetical character	Unexpected numeric character
DX	09	Not 3-5	000.x	Any alphabetical character other than E or V	No numeric characters
DX	10	Not 3-7	000.x or 999.x	First character is not alphabetical	No numeric characters
PX	CH	Less than 5	00000x or 99999x	n/a	No numeric characters
PX	09	Not 3-4	00.00	Any alphabetical character	n/a[1]
PX	10	Not 7	0000000 or 9999999	n/a	n/a
NDC	n/a	Not 11[2]	00000000000 or 99999999999	Any alphabetical character[2]	n/a[1]
RXNORM_CUI	n/a	Not 2-7	n/a	Any alphabetical character	n/a[1]
LOINC	n/a	Not 3-7	No hyphen in the penultimate position	Any alphabetical character	n/a[1]

1. Redundant with the unexpected alphabetical character rule.
2. Also checked as part of the data curation query.

III. Data Curation Query Definitions

The definitions for variables included in the data curation query output are as follows:

- ADMIT_DATE Mismatch: These fields are replicated from the ENCOUNTER table to the PROCEDURES and DIAGNOSES table. The number of mismatched records is the number of records in PROCEDURES or DIAGNOSIS where these fields do not match the value in the ENCOUNTER table.

VI. Program Package File Structure

Each request package distributed by PCORnet's DRN OC contains several sub-folders to organize program inputs and outputs. The subfolders must reside within an outer folder labeled with the query name designated in the DRN Query Tool, e.g. PROD_P02_DQA_FDPRO_DCQ_NSD1_c003_r001.
The subfolders are as follows:

- ***dmlocal***: Contains output generated by the request that should be saved locally but not returned to DRN OC. Output may be used locally or to facilitate follow-up queries.
- ***drnoc***: Contains output generated by the request that should be returned to the DRN OC via the PCORnet DRN Query Tool. These tables consist of aggregate data/output and transfer the minimum required to answer the analytic question.
- ***sasprograms***: Contains the master SAS program that must be edited and then executed locally.
- ***infolder****:* Contains all input programs and files needed to execute the request. These are created for each request by the DRN OC Data Curation team; the contents of this folder should not be edited.

VII. Files Included in Query Request

The following files are included in the Zip file distributed with the query request.

5	[DATAMARTID]_[RESPONSE_DATE]_ data_curation.pdf	data_curation_query.sas	A PDF containing a partial print of the output tables for the benefit of non-programmers. For ease of readibility, it excludes the first three columns of the table (DataMartID, Response Date, and Query Package), and large tables are limited to the 100 most frequent observations. Empty tables are not printed.
6	[DATAMARTID]_[RESPONSE_DATE]_ data_curation_query.log	data_curation_query.sas	The SAS log file for the program. Must be checked for errors and warnings.

9	[DATAMARTID]_[RESPONSE_DATE]_ EDCRPT.rtf	edc_report.sas	The report produced by the program.

IX. Responding to the Query Package

1) Prepare for the query as instructed in the Query Package Checklist.
2) Go to the DataMart Client and open the query package. Extract the contents, save them locally as described in Sections VI, and create the *drnoc* and *dmlocal* folders.
3) If the CDM data is stored in database tables, do the following. Otherwise proceed to Step 4.
   a) Consider compressing large tables to improve query response time.
   b) Open **run_queries.sas** and **data_curation_query.sas.** Modify the user inputs to use appropriate SAS/ACCESS options on a LIBNAME statement so that the program knows where to find the database tables. The examples below show connection information for an Oracle database; connecting to other database systems may require different connection information.
      (1) In the **run_queries.sas** and **run_code_errors.sas** programs, edit the `dpath` variable to include the appropriate database connection information. Be sure to use the `%str()` function to mask the embedded equal signs. For example: `%let dpath = %str(oracle user=”myuserid” orapw=mypasswd path=mydbname schema=myschema);`
      (2) In the **data_curation_query.sas** program edit the `libname pcordata` statement on Line 36 to remove the quotation marks, as: `libname pcordata &dpath;`
4) Open the programs in the *sasprograms* folder (**run_queries.sas** and **run_edc_report.sas)** and modify the directory paths and inputs as instructed below. For reasons of compatibility and standardization, directory paths must meet the following criteria:

   - DO use forward slashes (e.g. /) which are always compatible on both UNIX and WINDOWS.
   - DO use end of path separators (e.g. /xyz/ and not /xyz) which are assumed by many programs.
   - DO use beginning of path separators (e.g. /xyz) on UNIX.
   - DO NOT use beginning of path separators on WINDOWS (e.g. P:/xyz not /P:/xyz).
   - DO NOT surround directory paths with quotes (e.g. /xyz/ not "/xyz/").

   a) After `%let dpath=`, provide the directory path where your PCORnet CDM SAS data is located.
   b) After `%let qpath=`, provide the outer folder where the required folders were created.
   c) If applicable, after `%let threshold=`, provide the low cell count threshold value (default is 11).
5) Open the **run_queries.sas** program. The program will call **pcornet_code_errors.sas** and **data_curation_query.sas**. Run the **pcornet_code_errors** portion and review the log and output as instructed in the Query Package Checklist. Then run the **data_curation_query** portion. As it processes each query, the program will print results to a PDF file, create permanent SAS datasets for each output table, and import all permanent SAS datasets into a SAS transport file. Review the logs and output (see section VIII) as instructed in the Query Package Checklist.
6) Open and run the **run_edc_report.sas** program. The program will call **normalization.sas** and **edc_report.sas**. The **normalization.sas** program will create a dataset which combines all the data curation query output tables. The **edc_report.sas** program will create the EDC report from the normalized dataset and print results to a RTF file. Review the logs and output (see section VIII) as instructed in the Query Package Checklist.
7) Update the online ETL Annotated Dictionary as instructed in the Query Package Checklist.
8) If desired, verify the contents of the cpt files by using a `proc cimport` statement, as shown in the example below:

```
libname outlib 'F:/pcornet/myproject/';
%let infile= 'F:/pcornet/myproject/T1D3_20151101_data_curation.cpt';
proc cimport infile=&infile library=outlib; run;
```

9) Return the *drnoc* files (see section VIII) and Checklist as instructed in the Query Package Checklist.

XXVI. Version History

Date	Version	Description
Feb 3, 2016	v3.00	Original release.
Mar 17, 2016	v3.01	Corrected truncation of some query results by increasing field lengths. In VITAL_L3_HT, height categories of "<0" and "0-10" were both displaying as "0-10" due to a precision issue with PROC FORMAT/PROC MEANS; this was corrected. In PRO_L3_PXDATE_Y was incorrectly labeled ADMIT_DATE; this was corrected to PX_DATE. Updated all documentation and code to v3.01.
Nov 7, 2016	v3.02	Added queries of DEATH, DISPENSING, LAB_RESULT_CM, and PRESCRIBING (35 queries). Added 7 cross-table queries. Revised 14 queries (retained backwards compatibility). Revised the low cell count threshold logic to conform to PCORnet's new minimum bin size policy. Added the Empirical Data Curation Report.
Nov 18, 2016	v3.03	Eliminated the need for the SAS ACCESS/Interface to PC Files module. Resolves the following warning: "WARNING: In a call to the CATS function, the buffer allocated for the result was not long enough to contain the concatenation of all the arguments."
Mar 21, 2017	v3.04	Modified the program so that optional variables which are 100% missing will not cause errors or omissions. In ENC_L3_ENCTYPE, corrected the calculations for ELIG_RECORD_N and UNIQUE_VISIT_N. In XTBL_L3_DASH2 and XTBL_L3_DASH3, changed the logic to use PRESCRIBING. RX_ORDER_DATE instead of RX_START_DATE. In XTBL_L3_DASH3, changed the logic to not require LAB_RESULT_CM.LAB_NAME to be populated. In Empirical Data Curation (EDC) Table IIE, corrected the highlighting and added the PRESCRIBING table for orphan ENCOUNTERIDS. In Table IIIB, corrected the percentage calculations. In EDC Table IVD, corrected the "% of encounters without a principal diagnosis" calculation.
Jul 5, 2017	V3.10	Modified queries to conform to CDM v3.1. Added queries of the CONDITION, PCORNET_TRIAL, DEATH_CAUSE, and PRO_CM tables. Added 12 queries pertaining to previously characterized tables. Revised 31 queries. Incorporated PCORnet Data Checks v3.
Sept 18, 2017	V3.11	In the Data Curation query, corrected an omission in the "enc_l3_enctype_disdisp" query. In EDC Table IIB, added RX_QUANTITY_UNIT and corrected calculation for PX_TYPE. In EDC Table IVC, added DX_ORIGIN. In EDC Table IVE, corrected the percentage calculation.
Dec 21, 2017	V3.12	Incorporated the PCORnet Code Errors v4 program. In the Data Curation query, added 12 queries pertaining to previously characterized tables; revised 4 queries; and deprecated 6 queries. In the Empirical Data Curation report, incorporated PCORnet Data Checks v4, added Table IVG, and revised 14 tables.
